

Climate Change and Air Quality (Old)

Why study climate change and air quality?

The climate change and air quality track aims to train students in the physical and biological processes associated with global climate change and air quality, and to provide them with the necessary policy background to be able to understand the implications of global warming and climate change. Courses cover foundations of climatology and atmospheric science, air quality, hydrology, interaction between vegetation and the atmosphere, biogeography and evolution, biomes, and environmental policy making. This track would prepare students for a broad range of environmental and policy positions in the public and private sectors, such as the California Air Resource Board, U.S. Environmental Protection Agency, various county Air Quality Management Districts, environmental consulting firms, and graduate school in a broad range of environmental topics.
